

Alertisys⁷

Advanced System Monitoring Services

It's 3:00 a.m.. Are You Losing Money?

How it works

Alertisys is a service consisting of monitoring centers that remotely monitor your network and critical systems to make sure that all your devices are functioning correctly and operating within their given parameters. Alertisys support centers are running 24 hours a day, 7 days a week to make sure you know within minutes if one of your systems has a problem or has gone down.

The Scenario

Your company has entered the digital age. Your website accepts transactions, e-mail has become the preferred method of communication and document transmission between your staff and your clients, your locations are wired to each other and everything is wired to the internet. Information flows with more efficiency and cost savings than ever. This critical infrastructure is expected to run 24-hours a day, 7-days a week... so why is your support staff still working an 8 hour day?

Solutions

Alertisys compliments your support staff by giving them an around the clock set of ears and eyes. Even during work hours your IS Staff cannot sit and watch every computer, switch and router in your organization to make sure they are performing at peak efficiency. Alertisys utilize complex software and a highly trained staff of experts to not only monitor these devices remotely, but also trouble shoot problems as they occur, notify your staff at any time of day, and offer post-resolution suggestions for prevention of the problems in the future. Our services are custom tailored to each client and are available at a fraction of the cost of hiring a 24-hour staff of consultants and system administrators.

Powerful Tools

Alertisys empowers our clients with tools necessary to administrate all functions and parameters that we use in monitoring, notifying and escalating issues that relate to our service. Our clients can create or modify notification contacts based on time of day, day of week, severity of error, how long the device is on error, etc. using our powerful command console. You also can see detailed downtime reports which often times means refunds from your provider.

There is More

Alertisys has a lot more to offer for your company than connectivity monitoring. Our service centers and powerful software can monitor system and network resources remotely to ensure your network is always running at peak performance and with optimal efficiencies. Our staff will proactively call and notify you when resources such as Hard drive space, CPU Speed, and RAM are running low on internal systems that your staff relies on day-to-day. Knowing when a problem is coming and fixing it before hand can save you thousands of dollars in a single avoidable incident.

Why Alertisys

Lets face it; computers are not the most reliable devices in your company's infrastructure. However, they are quickly becoming the most important. Whether it's accounting, E-Commerce, e-mail or EDI these systems are a vital part to the way your company functions and communicates with vendors, partners, and clients. When these systems go down it critically impacts your reputation, communication and most importantly your bottom line. Partnering with Alertisys will save you from costly outages, consult you on maintaining a reliable and efficient infrastructure, and bring you peace of mind.
